9th International Workshop on the Physics of Compressible Turbulent Mixing

Cambridge, UK 19-23 July 2004

IWPCTM9

Topics

- Direct numerical simulation of RT&RM instabilities and mixing by codes NUT, MAX, EGAK;
- Comparison with experiments (S.Zaitsev);
- Wavelet analysis;
- Kohonen map for multi-dimensional space visualization;
- Neuro-network forecasting of instabilities and mixing development (Predictor);
- Mixing zone growth rate
- Prospects

Related reports on 9th IWCTM:

Problem statement (1)

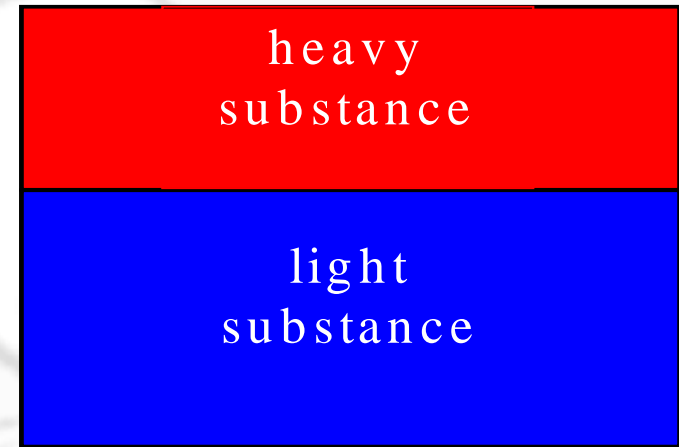

$$p = \frac{R}{\mu} \rho T \quad \varepsilon = \frac{1}{\gamma - 1} \frac{R}{\mu} T$$

Position of the contact boundary –

$$z(x) = \sum a_i \cos(k_i x + \varphi_i),$$

$$k_i = \frac{2\pi}{\lambda_i} = \frac{2\pi}{L} i, \quad i = 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37$$

external field

IWPCTM9

Problem statement (2)

Instabilities: RT, RM, limited time of development

Dimension: 2D and 3D

Amplitudes: $a_k^0 = a_0(k)$

$$\begin{cases} 1. a_k^0 k = \text{const} \Rightarrow a_k^0 = \frac{\text{const}}{k} \\ 2. a_k^0 = \text{const} \end{cases}$$

Modes: $N_{\text{max}} = 6, 8, 10, 12;$

$i = 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37$

Phases: random choice on the interval $0 - 2\pi$

Atwood number: Ar/Xe $A = 0.532$; He/Xe $A = 0.941$

Total number of simulations: 250

Physic values: the kinetic energy:

$$E_k = \int_{Z_{\text{min}}}^{Z_{\text{max}}} \int_{X_{\text{min}}}^{X_{\text{max}}} \rho \frac{u^2 + w^2}{2} dx dz$$

$$\int_{Z_{\text{min}}}^{Z_{\text{max}}} \int_{X_{\text{min}}}^{X_{\text{max}}} \rho w dx dz \quad : \text{ z-component of a momentum}$$

the width of the mixing zone:

$$L = Z_2 - Z_1$$

$$\int_{Z_{\text{min}}}^{Z_{\text{max}}} \int_{X_{\text{min}}}^{X_{\text{max}}} C \rho dx dz$$

: the mass of heavy fluids involved into mixing

the entropy:

$$H = \frac{1}{2} \int_{Z_{\text{min}}}^{Z_{\text{max}}} \int_{X_{\text{min}}}^{X_{\text{max}}} \Omega^2(x, z, t) dx dz$$

The width of the mixing zone (1)

$$L_i(t) = L_{0i} + \frac{\lambda_i \cdot f}{\alpha_{\text{eff}}} \cdot \left(\sqrt{1 + \frac{(\alpha_{\text{eff}} \cdot \gamma_i \cdot t)^2}{2\pi \cdot f}} - 1 \right)$$

$$\gamma_i^2 = \frac{2\pi}{\lambda_i} \cdot gA, \quad f = \frac{v^2(A)}{A}, \quad \alpha_{\text{eff}} = \alpha_0 \cdot \alpha_* / (\alpha_0 + \alpha_*),$$

$$V_{\lambda}^{\text{asympt}} = v \cdot \sqrt{g \cdot \lambda}, \quad k_i = \frac{2\pi}{\lambda}, \quad \alpha_0 = k_i \cdot a_{0i},$$

$$L(t) = \sum L_i(t) \cdot w_i(t), \quad L(0) = \sum L_i(0) \cdot w_i(0),$$

$$w_i(0) = \cos(k_i \cdot x_{\text{max}} + \varphi_i) - \cos(k_i \cdot x_{\text{min}} + \varphi_i),$$

$$w_i(t) = w_i(0) \cdot e^{-\gamma_{\text{KH}i} \cdot t} \Rightarrow e^{-\gamma_i \cdot t / n_i} \Rightarrow e^{-(\gamma_i \cdot t / n_i)^2}, \quad \gamma_{\text{KH}} \sim \frac{\gamma_i \cdot a_i}{\lambda_i} \Rightarrow \frac{\gamma_i}{n_i}$$

Conclusion (1)

From DNS

• Database created on the basis of 250 DNS on the development of instability and turbulent mixing of two gases for different regimes:

- RT and RM;
- 2D and 3D;
- different Atwood numbers;
- different mode numbers;
- different amplitudes on the mode number dependencies;

Database contains information on the pressure, velocity, density and enstrophy fields.

- The growth of mixing zone width is close to the linear one with time
- The width of the mixing zone does not depend strongly on the high mode contribution (The width slightly decreases with the inclusion of high modes)
- The width of the mixing zone for 3D and 2D cases for equal condition is approximately equal.

Conclusion (2)

From wavelet analysis

- Wavelet decomposition of density gives adequate representation of the instability and mixing development
- Kohonen maps can distinguish between different examples of the processes and can find similarity of the processes (if it really exists)
- interpretation of principal components of the wavelet space looks a very interesting investigation
- on this basis it is possible to suggest a predictor which can predict final results of instability and mixing development using the information on the initial state only.

Prospects

- 3D instabilities and turbulent mixing development, the wavelet analysis and so on.
- Wavelet analysis of other 2D fields (compare with the density) and their combination.
